REPORT

NAME: TEST PATIENT BETA **AGE/SEX: 68 / F**
REFD. BY: TEST REFERRING DOCTOR **DATE: 20/10/2026**
UHID: TEST-002 **ACCESSION: ACC-MRI-BRAIN-002**

MRI BRAIN

CLINICAL HISTORY:

Progressive cognitive decline, rule out neurodegenerative disease

TECHNIQUE:

Multiplanar, multisequence MRI of the brain was performed without intravenous contrast.
Sequences acquired: T1, T2, FLAIR, DWI.

FINDINGS:

Cerebral Hemispheres

Normal grey-white matter differentiation.

No focal mass lesion or hemorrhage.

White Matter

Mild chronic small-vessel ischemic changes involving the deep white matter bilaterally, more prominent in the periventricular regions.

No restricted diffusion.

Basal Ganglia and Thalami

Normal signal intensity bilaterally.

Ventricular System

Generalized ventricular enlargement, out of proportion to the patient's age.

Corpus Callosum

Normal morphology.

Thin body and splenium, consistent with generalized cerebral volume loss.

Midline Structures

Centered.

Brainstem

Normal morphology and signal intensity.

Cerebellum

Normal signal intensity.

Mild cerebellar volume loss.

Extra-axial Spaces

Prominent cortical sulci, consistent with generalized cerebral volume loss.

No extra-axial collection.

Sellar/Parasellar Region

Unremarkable.

Radiological diagnosis is not always conclusive & often vary with clinical course of the disease or response to treatment. This report is not for medico-legal purpose.

UHID: TEST-002 **ACCESSION: ACC-MRI-BRAIN-002**

Orbits
Normal.

Paranasal Sinuses
Clear.

Mastoid Air Cells
Clear.

IMPRESSION:
1. Mild chronic small-vessel ischemic changes of the deep white matter.
2. Generalized cerebral volume loss, moderate for age.

RECOMMENDATION:
Clinical correlation for vascular risk factor management recommended.

Dr. Sugandha Priyadarshini
MD (Radiodiagnosis & Medical Imaging)
