MIS-2016-0023

The visualized upper ends of tibia and fibula and the patella are unremarkable.

IMPRESSION: In a known case of GCT with post operative status MRI findings are:

- Epimetaphyseal region of distal femur reveals lytic expansile intraosseous lesion with altered signal intensities and associated cortical breach in the antero-medial aspect with adjoining minimal free fluid and soft tissue thickening as described -
- Few well defined T2W / STIR hyperintense and T1W isointense to mildly hyperintense areas within and one of the area showing fluid fluid level.

Please correlate with previous imaging studies.

Investigations have their limitations. Solitary investigations never confirm the final diagnosis of disease. It only helps in diagnosing the disease in correlation to the clinical symptoms.
