NAME: TEST PATIENT BETA **AGE/SEX: 68 / F**
REFD. BY: TEST REFERRING DOCTOR **DATE: 15/10/2026**
UHID: TEST-002 **ACCESSION: ACC-MRI-BRAIN-002**

MRI BRAIN

CLINICAL HISTORY:

Progressive cognitive decline, rule out neurodegenerative disease

TECHNIQUE:

Multiplanar, multisequence MRI of the brain was performed without intravenous contrast.

FINDINGS:

There are mild chronic small-vessel ischemic changes involving the deep white matter bilaterally, more prominent in the periventricular regions. Generalized cerebral volume loss is noted, with prominence of the cortical sulci and ventricular system out of proportion to the patient's age. No focal mass lesion, hemorrhage, or restricted diffusion. Midline structures are centered. The visualized paranasal sinuses and mastoid air cells are clear.

IMPRESSION:

1. Mild chronic small-vessel ischemic changes.

2. Generalized cerebral volume loss, moderate for age.

RECOMMENDATION:

Clinical correlation for vascular risk factor management recommended.

Dr. Sugandha Priyadarshini
MD (Radiodiagnosis & Medical Imaging)

Radiological diagnosis is not always conclusive & often vary with clinical course of the disease or response to treatment. This report is not for medico-legal purpose.
