REPORT

NAME: TEST PATIENT ETA **AGE/SEX: 42 / F**
REFD. BY: TEST REFERRING DOCTOR **DATE: 15/10/2026**
UHID: TEST-007 **ACCESSION: ACC-MRI-BRAIN-CS-001**

MRI BRAIN WITH CERVICAL SPINE SCREENING

This is a limited screening examination of the cervical spine. Dedicated cervical spine MRI is recommended if clinical symptoms persist or progress.

CLINICAL HISTORY:

Headache and neck pain, rule out intracranial and upper cervical pathology

TECHNIQUE:

Multiplanar, multisequence MRI of the brain was performed without intravenous contrast. Limited screening sequences of the cervical spine were also obtained.

FINDINGS:

BRAIN: The brain parenchyma demonstrates normal signal intensity. No focal mass lesion, hemorrhage, or restricted diffusion. Ventricles are normal in size and configuration. Midline structures are centered. The visualized paranasal sinuses and mastoid air cells are clear.

CERVICAL SPINE SCREENING: Limited evaluation of the visualized cervical spine demonstrates normal alignment. The visualized vertebral bodies maintain normal height and signal intensity. No gross disc herniation is identified on the screening sequences. The cervical cord appears normal in caliber within the limitations of the screening examination.

IMPRESSION:

1. Normal MRI of the brain.

2. Unremarkable limited cervical spine screening.

Dr. Sugandha Priyadarshini
MD (Radiodiagnosis & Medical Imaging)

Radiological diagnosis is not always conclusive & often vary with clinical course of the disease or response to treatment. This report is not for medico-legal purpose.
