REPORT

NAME: TEST PATIENT IOTA **AGE/SEX: 35 / M**
REFD. BY: TEST REFERRING DOCTOR **DATE: 15/10/2026**
UHID: TEST-009 **ACCESSION: ACC-MRI-LS-WHOLE-001**

MRI LUMBOSACRAL SPINE WITH WHOLE SPINE SCREENING

This is a limited screening examination of the thoracic and cervical spine. Dedicated imaging is recommended if clinical symptoms suggest pathology in these regions.

CLINICAL HISTORY:

Low back pain, rule out spinal pathology

TECHNIQUE:

Multiplanar, multisequence MRI of the lumbosacral spine was performed without intravenous contrast. Limited screening sequences of the entire spine were also obtained.

MEASUREMENTS:

Measurement	Value
L1-L2 Canal AP	15 mm
L2-L3 Canal AP	14.6 mm
L3-L4 Canal AP	14.3 mm
L4-L5 Canal AP	13.9 mm
L5-S1 Canal AP	13.6 mm

FINDINGS:

LUMBOSACRAL SPINE: Normal lumbar lordosis is maintained. Vertebral body heights and signal intensity are preserved. Disc heights are maintained at all levels. No disc bulge, protrusion, or extrusion. The thecal sac is normal. Neural foramina are patent bilaterally at all levels. The conus medullaris terminates at L1 level and demonstrates normal signal intensity.

WHOLE SPINE SCREENING: Limited evaluation of the visualized thoracic and cervical spine demonstrates normal alignment. The visualized vertebral bodies maintain normal height and signal intensity. No gross disc herniation or significant canal narrowing is identified on the screening sequences. The visualized spinal cord appears normal in caliber within the limitations of the screening examination.

IMPRESSION:

1. Normal MRI of the lumbosacral spine.

2. Unremarkable limited whole spine screening.

Dr. Sugandha Priyadarshini
MD (Radiodiagnosis & Medical Imaging)

Radiological diagnosis is not always conclusive & often vary with clinical course of the disease or response to treatment. This report is not for medico-legal purpose.
